Math 260 Assignments for Spring 2021 (due on given date)

for Monday, January 25

- 1. Read the syllabus carefully and watch the 37 minute youtube video https://youtu.be/OJMYghKY-Aw.
- 2. Read Section 1.1. Although some of the terms here may be new to you, they are not difficult and we will use them quite a bit in the next few weeks. There is no need to memorize all of these terms (especially those in Theorem 1.3) but you certainly need to be familiar with the connectives, truth tables, and the language associated with conditional statements (such as converse and contrapositive).
- 3. This is the first of many reading assignments. You need to learn how to read mathematics textbooks and (eventually) articles in mathematical journals; this is an important aspect of being prepared for higher mathematics. This type of reading is an acquired skill and takes plenty of patience to learn. You cannot skim, you cannot gloss over details, you may need to pause to think or write out some details, you may need to read a sentence or paragraph multiple times before it is clear, or you may get completely stumped. If you do get stuck at some point, do not just quit reading; put a question in the margin and keep going, trying to make as much sense as you can of what follows. Sometimes your questions will be answered later (either in the text or with a flash of insight). However, if your questions are not resolved, it is important that you ask for help. Also, you need to be certain that you are not fooling yourself into thinking that you actually understand when you really do not.
- 4. Do exercises 1, 2a, 2d, 3h, 3k (the letters on exercise 3 refer to the parts of Theorem 1.3), 4, and 5 in Section 1.1. We should have time to discuss these at our first class meeting if necessary.
- 5. Turn in solutions for exercises 5a and 5c from Section 1.1. (Note that the instructions to consider different universes are relevant for exercise 5a: real numbers versus complex numbers.) Write your solutions very carefully and provide reasons for your answers of true or false. Your solution should include the original statement, along with the converse and the contrapositive, all written clearly. This is your first opportunity to show me the quality of your written work so it would be in your best interest to get off to a good start. The assignment is due by 9:00 am (Pacific time) and the name of your file should be email_hw_01.pdf, where email refers to the portion of your email address prior to @.

for Wednesday, January 27

- 1. Read Section 1.2. Remember to read carefully and to make certain you understand each and every statement. For this section, you should probably pause to reflect at times and create further examples. If you have any questions, write them down and ask them in class, via email, or during office hours.
- 2. You should work all of the exercises in this section; each exercise should only take a few minutes.
- 3. Turn in solutions for exercises 2, 5, and 6d from Section 1.2. For exercises 2 and 5, you should include the verbal statement along with the symbolic statement. This means that you need to copy some version of the exercise before writing the solution. For exercise 6d, you will need a complete sentence or two, along with an algebraic equation, for your explanation. Once again, think about how you are writing and presenting mathematics. The assignment is due by 9:00 am (Pacific time) with file name email_hw_02.pdf.

for Friday, January 29

- 1. Read Section 1.3 carefully and ponder the implications of quantifiers and their negations. The examples presented in the 43 minute youtube video https://youtu.be/GAW23o-Z5cM may be helpful. Also read the biography of De Morgan; you should be "nerdy" enough (in a good way:)) to determine the year in which he was born. Do you have friends or relatives who can make a similar claim?
- 2. Be prepared to discuss exercises 1, 2, 3, 4, and 7 in Section 1.3. This means that you should do the exercises and be able to explain your solution to some other student in the class.
- 3. Turn in solutions for exercises 7b, 7c, and 7e from Section 1.3. You do not have to use symbols and quantifiers to negate these definitions but you may use them if you find them helpful. Really work on the wording of the negations to make sure they are clear and be certain that only simple sentences are negated. Since the terms in 7c are probably unfamiliar, you do not need to give any examples, but you should provide examples for the other two definitions. This means to give an example that illustrates the definition and one that illustrates the negation of the definition. In fact, it is a good idea to come up with a variety of examples to help clarify the concept. The purpose of these definitions is not so much that you grasp them fully but that you are exposed to some common terms from higher mathematics and that you can work with them symbolically even if you are unclear as to their meaning. The assignment is due by 9:00 am (Pacific time) with file name email_hw_03.pdf.

for Monday, February 1

- 1. Read Section 1.4. You may need to read very slowly in a few places and think carefully about the implications of the order of the quantifiers. You should also spend some time watching and pondering the 42 minute youtube video https://youtu.be/W_XOPqhxOVc.
- 2. Be prepared to discuss exercises 1, 2, 3, and 4a–e from Section 1.4. Make sure you have clear reasons to support your answers for these exercises.
- 3. Turn in solutions for exercises 4b and 4e from Section 1.4. As before, word your negated definitions carefully. Rather than provide examples this time, use your negated definitions to carefully prove each of the following:
 - i) the sequence $\{\sqrt[3]{n}\}$ is not bounded;
 - ii) the function $f(x) = \begin{cases} \cos(\pi/x), & \text{if } x \neq 0; \\ 0, & \text{if } x = 0; \end{cases}$ is not continuous at 0.

The assignment is due by 9:00 am (Pacific time) with file name email_hw_04.pdf.

for Wednesday, February 3

- 1. Read Sections 1.5 and 1.6. Since sets appear in almost all areas of mathematics, it is important to acquire a firm understanding of them and their associated notation. The concepts of pairwise disjoint, partition, and power set (defined in Section 1.6) are important. You should watch the 49 minute youtube video https://youtu.be/ka2Tsrb5uPg.
- 2. Do exercises 1abcfg, 2, 4ef, 5, and 8 in Section 1.5 and exercises 1, 2, 3, 6, and 10 in Section 1.6. Most of these should be go quickly.
- 3. Turn in solutions for exercises 1.5.5, 1.6.2, and 1.6.6. Your proof for exercise 1.5.5 should look something like (as in really look like this: format, aligned = signs, reasons, etc.)

$$(A \setminus B) \cup (B \setminus A) = (A \cap B^c) \cup (B \cap A^c)$$
 (Exercise 3)

$$= \qquad \qquad \text{(Theorem 1.10 e)}$$

$$\vdots \qquad \qquad (3 \text{ more steps, give reasons)}$$

$$= \qquad \qquad \text{(De Morgan's Laws)}$$

$$= (A \cup B) \setminus (A \cap B) \qquad \text{(Exercise 3)}$$

The assignment is due by 9:00 am (Pacific time) with file name email_hw_05.pdf.

for Friday, February 5

- 1. Read Section 1.7 and work to understand this new concept. This is the first section in which proofs of results play a more prominent role so study them carefully. You should watch the 37 minute youtube video https://youtu.be/MQUF7UYyBLY.
- 2. Do exercises 1, 2, 3, 8, and 9 from Section 1.7. Even if a result seems "obvious", make certain you can write out the details to show how it works.
- 3. Turn in solutions for exercises 8 and 9a in Section 1.7. For exercise 1.7.8, be extremely thoughtful so that fractions and division do not appear in your solution; there are easy ways to prove the transitive property that do not involve fractions. The reason that no fractions should appear is due to the fact that the universe involves integers. In fact, this equivalence relation is used to **define** the rational numbers. The written assignment is due by 9:00 am (Pacific time).

for Monday, February 8

- 1. Read the introduction to Chapter 2 and Section 2.1. Since we are beginning proofs in earnest now, read very carefully and make note of any questions or confusions that arise. You should also watch the 23 minute youtube video https://youtu.be/OVnxwEdS89A.
- 2. Be prepared to discuss exercises 1–11 from Section 2.1.
- 3. Turn in a carefully written two column logic proof (as in the text) for the following:

Prove
$$P \Rightarrow Q$$
; given R , $(P \land R) \Rightarrow S$, $\neg Q \Rightarrow \neg T$, $S \Leftrightarrow T$.

4. Turn in solutions for exercises 7 and 11 from Section 2.1. For exercise 7, you can closely imitate the examples in the text; do include the parenthetical remarks this one (and probably only) time. There are several ways to solve exercise 11; feel free to use previous results and/or exercises in this section by referring to them by number. Most likely, you will have to rewrite your proof for this exercise at least once if you want it to read well. The written assignment is due by 9:00 am (Pacific time); note that there are three problems to turn in.

for Wednesday, February 10

- 1. Read Section 2.2 carefully. Although a|b is a simple notion and one that is familiar to you, it is very important that you learn how to work with this concept at a deeper level. Note that this concept does not involve fractions or rational numbers or division in the usual sense. Recall that definitions are like formulas; you need to know them inside and out. Just as you can immediately tell someone the derivative of x^2 , you should be able to readily quote (essentially verbatim) the definition for a|b. You may also watch the 20 minute youtube video https://youtu.be/GWf4gr_VN-c.
- 2. Be prepared to discuss exercises 1–8 in Section 2.2. For Exercise 2, use the definition of n|(2n+3) and then some factoring to learn something about n. The proofs requested in exercise 3 should follow easily from the definitions. For exercise 4, consider using part (f) of Theorem 2.7, which is a very powerful result. Finding a has nothing to do with the proof; it is just an interesting aspect of the numbers.
- 3. Turn in solutions for exercises 4 and 8d in Section 2.2. Since the statement that you are proving in exercise 8d is a biconditional, two proofs are required. This assignment is due by 9:00 am (Pacific time).

for Friday, February 12

- 1. Read Section 2.3. This should be an easier section since it is about finding examples rather than writing proofs. However, it is important to note that it can be difficult to find examples in certain situations. The 42 minute youtube video https://youtu.be/PQLjEa6qluk illustrates some creative ways to demonstrate the existence of certain things.
- 2. Be prepared to discuss all of the exercises from Section 2.3; be sure to read the heading of the exercises.
- 3. Turn in a solution for exercise 12 in Section 2.3. Be certain to carefully describe how you went about finding a solution. In addition, turn in a solution for exercise 9 in Section 2.2. The statement of the problem and your solution to this problem should be typeset in LATEX. This assignment is due by 9:00 am (Pacific time).

for Monday, February 15

- 1. No class on this date due to President's Day.
- 2. The first special assignment is due a week from today, February 22. See the link on the webpage for the class to find this assignment.

for Wednesday, February 17

- 1. Read Section 2.4. The Principle of Mathematical Induction is extremely important and, once you grasp the essential idea and learn how to write PMI proofs well, is a powerful method for proving certain types of results. However, this technique of proof is notorious for causing confusion for many people so do study it carefully.
- 2. Do exercises 2, 3, 4, 5, 6, 7, and 9 in Section 2.4. Do not use induction for exercise 4. Rather, find a way to use the formula from exercise 2 (think about adding and subtracting the even cubes) to quickly find and establish a formula for the sum given in exercise 4.
- 3. Turn in a carefully written solution for exercise 6 using the informal style for induction proofs. You might find the simple fact $\frac{1}{(k+1)!} \le \frac{1}{k(k+1)}$ helpful in your proof. This assignment is due by 9:00 am (Pacific time).
- 4. Look over the proofs found at the link 'Model Induction Proofs' on the course website. There you will find a proof of a simple result along with three poorly written proofs of the same result, all taken from common student errors. If you do not spot the errors, please let me know as it is important that you become critical readers of proofs. You should probably try exercise 5 on your own (after studying Theorem 2.13) before reading the solutions online. For the record, it is possible to prove most of the results in this section without induction (essentially by appealing to other results that are already known and require induction to prove). If you have time, it is good practice to ponder these other solution methods.

for Friday, February 19

- 1. Read Section 2.5 very carefully. Be certain that you truly understand the proofs of these two major results. Recall that the purpose of this course is to prepare you for higher mathematics and the ability to read and follow proofs is one of the skills necessary for success in upper level mathematics classes. Do not "fake" yourself into believing you understand a proof when you really don't; ask questions about anything that seems unclear. If one step does not make sense, do not give up on the proof. Just believe the result that you do not understand and see if the rest of the proof makes sense from that point on.
- 2. Do exercises 1, 2, 4, 9, 10, and 11 in Section 2.5.
- 3. Turn in solutions for the following two problems: the assignment is due by 9:00 am (Pacific time).
 - i. Prove that for each positive integer $n \ge 2$, the inequality $\frac{4^n}{2n} < \binom{2n}{n}$ is satisfied.
 - ii. Find the maximum value of x^2y subject to the conditions x > 0, y > 0, and 4x + 3y = 30. (Do not use calculus.)

for Monday, February 22

- 1. Read Section 2.6. Be certain you understand the distinction between the two forms of induction and try to use the form that is most appropriate for the given situation. The FTA is very important so make sure you know what it says and how to prove it. The boring form of induction is certainly boring but it is important to know how it works and to notice how often it implicitly appears.
- 2. Work on exercises 1, 3, 4, and 5bdef in Section 2.6. At this stage of the learning process, you should be focusing on the induction step as the basic idea behind induction proofs should be clear by now. For exercise 3, you might want to write out the cases n = 8 to n = 16 to see what is going on and why strong induction is needed. Be very careful with the equation found in exercise 5d. In particular, note that the "long" sum always has an odd number of terms and always ends with a Fibonacci number with an even subscript. Checking the cases n = 1, n = 2, and n = 3 would be a good idea. Note that strong induction is not needed here.
- 3. Turn in a solution for exercise 3 from Section 2.6. This assignment is due by 9:00 am (Pacific time).
- 4. Special assignment #1 is also due by 9:00 am (Pacific time).

for Wednesday, February 24

- 1. Read Section 2.7. The Division Algorithm is rather important so read the proof carefully and fill in the missing details; this includes solving exercise 3 at the end of the section.
- 2. Work on exercises 2, 4, 6, and 8 in Section 2.7. You have an example to imitate for exercise 2. Do exercise 4 without a calculator. Exercise 6 may seem trivial but do write out the proof carefully. For the uniqueness part, start with "Suppose that y and z both satisfy the equation" then prove that y = z. Exercise 8 comes with directions as well; follow them.
- 3. Turn in solutions for exercises 6 and 8 in Section 2.7. This assignment is due by 9:00 am (Pacific time).
- 4. We will spend our class time discussing the upcoming exam.

for Friday, February 26

1. We have a test covering Chapter 1 and Sections 2.1 to 2.7.

for Monday, March 1

1. There is no specific assignment for this day; we will go over the exam and discuss Section 2.8 during our Zoom class period.

- 1. Read Section 2.8. Indirect proof is a good way to go in some cases, but try not to overdo it.
- 2. Work on exercises 1 through 11 in Section 2.8. For some of the exercises that request examples, you might want to go to https://www.wolframalpha.com/ and type a command such as "factor the integer 2*17*23 + 1 into primes".
- 3. Students will share their screen and present the following solutions:

Exercise 1: Moses

Exercise 2: Iris, using a direct proof

Exercise 2: Elena, using an indirect proof

Exercise 4: Myan

Exercises 5 and 10: Conor

Exercise 6: Rohan (let n = ab with $a \ge 3$ odd and expand the quantity $((2^b + 1) - 1)^a$)

Exercise 9: Aby

Exercise 11: Sam

4. Turn in a solution (using LAT_EX) for exercise 3. This assignment (named email_hw_14.pdf) is due by 9:00 am (Pacific time).

for Friday, March 5

- 1. Read Section 3.1. Congruence is an elementary concept once you become familiar with it, but you do need to think carefully about its meaning and properties.
- 2. Work on all of the exercises in Section 3.1; most of these should go rather quickly, but there are a few that take a bit more time. For exercises 4, 5, and 6, be certain to use congruence properties even though there are other ways to proceed.
- 3. Turn in solutions for exercises 2 (a proof of part (7) only), 8f, and 9. Write your solutions carefully even for exercises that involve computations. Your solution to exercise 2 should not be very involved; if it is, look for a better way. For exercise 9, note that x must have the form 17k + 4 to solve the first congruence. Now substitute this into the second congruence and determine k. This assignment (named email_hw_15.pdf) is due by 9:00 am (Pacific time).
- 4. Anika will present a solution for Exercise 3.1.6.
- 5. The second special assignment is due a week from today, March 12. See the link on the webpage for the class to find this assignment.

for Monday, March 8

1. No class on this day; it is the first day of our scattered spring break.

- 1. Read Section 3.2. Since we are beginning a study of an abstract space, you really need to work hard to understand what is going on.
- 2. Be prepared to discuss exercises 1–7 in Section 3.2.
- 3. Turn in solutions for exercises 3e (that is, give a proof of part (e) of the theorem), 10a, and a modified version of 6 from Section 3.2. You need to be extremely careful for the proof requested in exercise 3e. Pretend that you are trying to defuse a bomb and a wrong move will blow up the classroom. Make certain that every single step has a reason, one that you can verify from the text, not just because "it has to be true." You should start with the left-hand side of the equality and perform five (5) steps, each one with a clear reason, the last one being the right-hand side of the equality. You can line up the equations and provide the reason off to the side. The modification for exercise 6 is to consider the space \mathbb{Z}_{65} rather than the space \mathbb{Z}_{14} . Use the notion of congruence for your proof of Exercise 10a. This assignment (named email_hw_16.pdf) is due by 9:00 am (Pacific time).

for Friday, March 12

- 1. The second special assignment (see the March 5 assignment) is due by 9:00 am (Pacific time); the name of the file should be email_sp_02.pdf.
- 2. Read Section 3.3 carefully. Computationally, the Euclidean algorithm is quite elementary. However, the results given in Theorems 3.11 and 3.13 are extremely (as in EXTREMELY) important. Keep track of any questions that arise during the reading, especially any that occur while reading the second proof of Theorem 3.11.
- 3. Do exercises 1, 7, 10, and 11 in Section 3.3, thinking very carefully about the proofs that are needed. Try doing the computations for exercise 1 as efficiently as possible, preferably without technology.
- 4. Turn in a solution for exercise 11 in Section 3.3. This assignment (named email_hw_17.pdf) is due by 9:00 am (Pacific time).

for Monday, March 15

- 1. Read Section 3.4 carefully.
- 2. Work on exercises 5–15 in Section 3.4.
- 3. Students will present solutions to the following exercises in this section via screen share as follows: Sam (parts e and f of 7), Myan (8), Conor (11), and Rohan (13).
- 4. Turn in solutions for exercises 5 and 15 in Section 3.4. Present two proofs for Exercise 15; one using induction (start with a linear combination of f_n and f_{n+2} that equals 1 and then generate a linear combination of f_{n+1} and f_{n+3} that equals 1) and another using the result of Exercise 2.6.5e. This assignment (named email_hw_18.pdf) is due by 9:00 am (Pacific time).
- 5. The third special assignment is due a week from today, March 22. See the link on the webpage for the class to find this assignment.

- 1. Read Section 3.5, paying careful attention to the details in the proof of Theorem 3.29.
- 2. Work on exercises 1–9 in Section 3.5.
- 3. Students will present solutions to the following exercises in this section via screen share as follows: Moses (1), Elena (4), Aby (the second part of 6, using the first part and Theorem 3.29), and Iris (9).
- 4. Turn in solutions for exercises 6 (just the first equality involving the gcd) and 8. For Exercise 6, use Theorem 3.25. For Exercise 8, you should use exercises 3.5.6, 3.3.11, and 3.4.11 in your proof. This assignment (named email_hw_19.pdf) is due by 9:00 am (Pacific time).

for Friday, March 19

- 1. Read Section 3.6. Think carefully about the examples presented at the beginning of the section to better appreciate the need for a proof of the FTA, then be certain that you understand the proof of the FTA and the results that lie behind it. Read Theorems 3.31 through 3.33 enough times so that the notation does not disguise the simple ideas that they express.
- 2. Work on exercises 1, 2, 6, 7, 9, 10, 11, and 16 in Section 3.6.
- 3. Anika will present a solution for Exercise 7.
- 3. Turn in solutions for part (b) of Exercise 1 (your example must NOT involve a perfect square) and Exercise 16 (giving a direct proof of the contrapositive). This assignment (named email_hw_20.pdf) is due by 9:00 am (Pacific time).

for Monday, March 22

- 1. The third special assignment (see the March 15 assignment) is due by 9:00 am (Pacific time); the name of the file should be email_sp_03.pdf.
- 2. Review the first six sections of Chapter 3, recording any questions that you may have.

for Wednesday, March 24

1. We will review for the test on Friday.

for Friday, March 26

1. Our second exam is on this day. It will be a take-home exam focusing on the material we have covered since the last exam.

for Monday, March 29

1. There is no specific assignment for this day; we will use class time to discuss the exam and some of the concepts in Section 3.7.

- 1. Read Section 3.7. Expect to spend at least an hour reading through the details of the proofs and results in this section. Keep track of any questions that you have.
- 2. Since there are many exercises in this section, focus on exercises 3, 4, 5, 10, 11, 14, and 15. You will notice that many of these are computational in nature and provide practice with the ideas used or developed in this section. Try to be as efficient as possible in your computations, taking advantage of modular arithmetic and results in this section.
- 3. Students will share their screen and present the following solutions:

Exercise 3be: Conor

Exercise 4: Iris, find as many values as you can

Exercise 5: Elena

Exercise 10: Myan

Exercises 11: Aby

Exercise 14: Rohan

Exercise 15: Sam

3. Turn in a solution for exercise 6 in Section 3.7. Note that you simply need to give an example and prove that it works. However, you must provide an example for each integer e > 2; you cannot simply give an example for e = 3 or e = 4 and be done. You want a formula (in terms of e) that gives an example for each such e. This assignment (named email_hw_21.pdf) is due by 9:00 am (Pacific time).

for Friday, April 2

- 1. Carefully read and study Section 3.8 through the statement of Theorem 3.47. Remember that there is a distinction between understanding a theorem and being able to apply it versus understanding its proof. But do read the proofs carefully and record any questions that arise.
- 2. Work on exercises 1 through 7, doing your computational work without the aid of a calculator.
- 3. Anika will present a solution to Exercise 6bd.
- 4. Turn in solutions for exercise 4 and the extra exercise 6 problem of determining $\left(\frac{13}{41}\right)$: do this problem two ways, one using Euler's criterion and the other using the Quadratic Reciprocity Theorem. Just to be sure it is clear, for exercise 4, you want to prove the following:

```
If p is an odd prime and (b, p) = 1, then for each x \in \{1, 2, 3, \dots, p-1\} there exists a unique y \in \{1, 2, 3, \dots, p-1\} such that xy \equiv b \pmod{p}.
```

This assignment (named email_hw_22.pdf) is due by 9:00 am (Pacific time).

for Monday, April 5

- 1. Read the rest of Section 3.8, doing your best to understand the proof of Theorem 3.47.
- 2. Work on exercises 8, 9, 10 and 11 in Section 3.8.
- 3. Turn in solutions for exercises 8 (it is not as scary as it may first appear) and 10 (showing your computations clearly). This assignment (named email_hw_23.pdf) is due by 9:00 am (Pacific time).
- 4. The fourth special assignment is due a week from today, April 12. See the link on the webpage for the class to find this assignment (details to come).

for Wednesday, April 7

1. No class on this day; it is the third day of our scattered spring break.

for Friday, April 9

1. Go to the website http://www.ams.org/mathscinet/msc/msc2010.html and spend some time navigating around the subject classification. By clicking on the "Browse Classification" box, you can see the various subject headings and then continue going into more depth by clicking on a given two digit number. Spend some time reading all of the headings and then go into more depth for several of those that intrigue you. The purpose for having you spend some time looking over these areas is to give you a sense of the scope of mathematics.

Next, you can try the link http://www.whitman.edu/penrose/ Click on Databases and More+, then Database A–Z and the subject guide link that is there. Choose Mathematics and finally Click on MathSciNet. Try typing in the name of a person in the mathematics faculty to see what we have published of late. For example, you can type 'Gordon, R*' in the author box and see what comes up. You can also look for various topics. You can type 'Binomial Theorem' in the review text box to see a list of papers that make use of this term. This is a good resource when you are looking for reviews of papers published in the last 80 years or so.

Finally, go to the site https://en.wikipedia.org/wiki/List_of_mathematics_journals and scroll down the list of journals, just skimming the titles. If you become intrigued by a title, click on the link and check out the table of contents of a recent issue of the journal.

2. When you are finished with item (1) (I am assuming that you spend at least 30–45 minutes doing this but you do not need to do much more unless you become curious), write two or more paragraphs (take the writing seriously) on the links you browsed and your impressions (personal or otherwise) concerning mathematics after surfing these sites and developing a sense for the scope of the field of mathematics. It is preferred that you typeset your paragraphs using LATEX. This assignment (named email_hw_24.pdf) is due by 9:00 am (Pacific time).

for Monday, April 12

- 1. The fourth special assignment (see the April 5 assignment) is due by 9:00 am (Pacific time); the name of the file should be email_sp_04.pdf.
- 2. Spend about an hour carefully reading Section 3.9. If you take your time, you should find that the proof of Theorem 3.49 is really not that difficult to follow. Note the use of the Well-Ordering Property in the second part of the proof.
- 3. Work on exercises 1 through 6 in Section 3.9.

for Wednesday, April 14

- 1. Look over the attached pdf file (and the tablet notes) on the sum of the reciprocals of the primes and make note of any questions you may have.
- 2. Turn in a solution for exercise 5 in Section 3.9. This assignment (named email_hw_25.pdf) is due by 9:00 am (Pacific time).

for Friday, April 16

- 1. Read Section 4.1. These ideas may seem simple (and they are probably quite familiar) but do give them careful thought, especially when the sets A and B are not sets of numbers.
- 2. Be prepared to discuss exercises 1–6 in Section 4.1; I will not be collecting any solutions to exercises from this section.
- 3. Students will share their screen and present the following solutions:

Exercise 1: Conor

Exercise 2: Myan (parts abcd) and Elena (parts efgh)

Exercise 3: Iris

Exercise 4: Aby (parts abcd) and Anika (parts efgh)

Exercise 5: Rohan, try to find an example where A is a finite set and one where $A = \mathbb{R}$

Exercise 6: Sam

for Monday, April 19

- 1. Read Section 4.2.
- 2. Be prepared to discuss all of the exercises in Section 4.2. Students will share their screen and present the following solutions: Rohan (1), Sam (2), Conor (3), Iris (4), Elena (5), Aby (5), and Myan (8). You should be able to do exercise 4 without technology; note that parts (b) and (d) require careful reasoning (and perhaps a graph) to justify your answers.
- 3. Turn in a solution for exercise 7 in Section 4.2. Although it may seem a bit verbose, give a careful proof (a "chasing points" proof) that each set is a subset of the other. This assignment (named email_hw_26.pdf) is due by 9:00 am (Pacific time).
- 4. The fifth special assignment is due a week from today, April 26. See the link for special assignments on the course webpage.

for Wednesday, April 21

- 1. Read Section 4.3 and think carefully about these new terms.
- 2. Be prepared to discuss the exercises in Section 4.3. Many of these exercises request examples or ask simple questions so be prepared to present your ideas to the class. For exercise 10, give a direct proof that uses the standard definition of surjective functions; avoid using induced set functions. This should be a "follow your nose" type proof but do write the details clearly, probably in five short sentences.
- 3. Turn in solutions for exercises 8 (note that all of the inputs are positive integers) and 10 (see the comment in item (2)) from Section 4.3. This assignment (named email_hw_27.pdf) is due by 9:00 am (Pacific time).

for Friday, April 23

1. There is nothing due this day since Thursday is the fourth day of our scattered spring break.

for Monday, April 26

- 1. The fifth special assignment (see the April 19 assignment) is due by 9:00 am (Pacific time); the name of the file should be email_sp_05.pdf.
- 2. Read Section 4.4 (it is very short).
- 3. Be prepared to discuss exercises 1–5 in Section 4.4.
- 4. Turn in a solution for exercise 5 from Section 4.4. Hopefully, I discussed the general idea behind this problem in class. Your table should look a bit like the multiplication table for U₉ on page 77, resulting in a matrix of letters. The product a * b means the left side column entry a times the upper row entry b. This assignment (named email_hw_28.pdf) is due by 9:00 am (Pacific time).

for Wednesday, April 28

- 1. Read Section 4.6. (We are omitting Section 4.5.)
- 2. Be prepared to discuss exercises 1, 2, 3, 9, and 10 from Section 4.6.
- 3. Turn in a solution for exercise 10 in Section 4.6. This assignment (named email_hw_29.pdf) is due by 9:00 am (Pacific time).

for Friday, April 30

1. We have our third exam this day: the details were discussed in class and are also listed on the exam.

for Monday, May 3

1. Assuming that I am able to get the tests graded in time, look over your exam and bring any questions that you have to class.

for Wednesday, May 5

- 1. Read Section 4.7 carefully and think deeply about the ideas that are discussed. This is a longer section and it contains some rather strange ideas concerning different sizes of infinity. If necessary, you can skim the proofs of Theorems 4.32 and 4.33.
- 2. Work on exercises 1, 2, 3, 7, and 8 in Section 4.7. Students will share their screen and present the following solutions: Conor (1abc), Elena (1def), Rohan (1gh), Iris (3), Sam (7 part 3), Aby (7 part 8), and Myan (8).
- 3. Turn in a solution for exercise 2 in Section 4.7, giving careful proofs of injectivity and surjectivity; you should use the FTA in your proof. This assignment (named email_hw_30.pdf) is due by 9:00 am (Pacific time).

for Friday, May 7

1. No class on this day; it is the fifth day of our scattered spring break.

for Monday, May 10

- 1. Read Section 4.8 and ponder these ideas carefully.
- 2. There is an optional special assignment due on this day; see the usual link at the course website.
- 3. We will talk about the class as a whole and do some review for the final.
- 4. Begin your review by flipping through the textbook to remind yourself of the topics we have covered this semester. Hopefully, you will be surprised how much of it is familiar to you. The final exam is comprehensive so look over all of the sections except for Section 4.5. The next thing to do is to look over assigned problems, both those in the textbook and those in the special assignments. You should read the question without looking at your solution as a way to check if you remember how to get the problem started. Once you have this higher level figured out, then you can focus on specific details.
- 5. Remember that you should ponder options for solving a problem before thinking too much about all of the details. Your first inclination for solving a problem may work, but it may be very awkward and/or time consuming; it could also just be wrong. It is important that you learn which theorems and computations are most appropriate for a given problem.
- 6. I will be paying more attention than usual to your writing and formatting of solutions. Hence, you will want to save time for a careful proof-reading of your exam before submitting it.
- 7. At the site http://people.whitman.edu/~gordon/mathwrittens.html, you can click on the Intro to Higher Math link for some further information and some problems to try. Our final exam will be more involved than the information presented here for math writtens, but it is one place to see some problems without having an implicit hint based upon the section of the textbook.
- 8. I will send out the exam at 4:30 pm on Friday, May 14 and it will be due by noon on Monday, May 17, when our scheduled final exam time ends. As mentioned in an earlier email, I will require that the solutions be written in LATEX; part of your grade will depend upon your careful writing of solutions. Remember to attempt to find a good balance for margins and line spacing.

for Monday, May 17

1. The final exam is due by noon (Pacific time) on this day. Remember that you are to work alone on this exam and you are not allowed to use resources other than our textbook and other course materials. The name of your solutions file (in two parts) should be as indicated on the exam copy. Please follow the other guidelines for the format of solutions.
