Trivial solutions occur when x = y.

Trivial solutions occur when x = y.

One simple nontrivial solution is $2^4 = 4^2$.

・ロト・日本・モト・モート ヨー うへで

Trivial solutions occur when x = y.

One simple nontrivial solution is $2^4 = 4^2$.

We can seek solutions in the set of integers, the set of rational numbers, the set of real numbers, or the set of complex numbers.

Trivial solutions occur when x = y.

One simple nontrivial solution is $2^4 = 4^2$.

We can seek solutions in the set of integers, the set of rational numbers, the set of real numbers, or the set of complex numbers.

We restrict ourselves to the set of positive real numbers.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

Denote the value of y corresponding to x by E(x).

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

Denote the value of y corresponding to x by E(x).

It follows that
$$\frac{\ln x}{x} = \frac{\ln E(x)}{E(x)}$$
.

Denote the value of y corresponding to x by E(x).

It follows that
$$\frac{\ln x}{x} = \frac{\ln E(x)}{E(x)}$$
.

Hence, solutions to $x^y = y^x$ correspond to horizontal chords on the graph of $\beta(x) = \frac{\ln x}{x}$.

<□ > < @ > < E > < E > E のQ @

$$x^{y} = y^{x} \quad \Leftrightarrow \quad t x \ln x = x \ln(t x)$$
$$\Leftrightarrow \quad t \ln x = \ln t + \ln x$$
$$\Leftrightarrow \quad \ln x = \frac{\ln t}{t - 1}$$

<□ > < @ > < E > < E > E のQ @

$$x^{y} = y^{x} \quad \Leftrightarrow \quad t x \ln x = x \ln(t x)$$
$$\Leftrightarrow \quad t \ln x = \ln t + \ln x$$
$$\Leftrightarrow \quad \ln x = \frac{\ln t}{t - 1}$$

Parametric equations for the curve y = E(x) are thus

$$x(t) = t^{1/(t-1)}, \qquad y(t) = t^{t/(t-1)}$$

as t runs from 0 to ∞ .

$$x^{y} = y^{x} \quad \Leftrightarrow \quad t x \ln x = x \ln(t x)$$
$$\Leftrightarrow \quad t \ln x = \ln t + \ln x$$
$$\Leftrightarrow \quad \ln x = \frac{\ln t}{t - 1}$$

Parametric equations for the curve y = E(x) are thus

$$x(t) = t^{1/(t-1)}, \qquad y(t) = t^{t/(t-1)}$$

as t runs from 0 to ∞ .

$$t = 3$$
 yields $x = \sqrt{3}$ and $y = 3\sqrt{3}$: $\sqrt{3}^{3\sqrt{3}} = (3\sqrt{3})^{\sqrt{3}}$

$$x^{y} = y^{x} \quad \Leftrightarrow \quad t \times \ln x = x \ln(t x)$$
$$\Leftrightarrow \quad t \ln x = \ln t + \ln x$$
$$\Leftrightarrow \quad \ln x = \frac{\ln t}{t - 1}$$

Parametric equations for the curve y = E(x) are thus

$$x(t) = t^{1/(t-1)}, \qquad y(t) = t^{t/(t-1)}$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

as t runs from 0 to ∞ .

$$t=3$$
 yields $x=\sqrt{3}$ and $y=3\sqrt{3}$: $\sqrt{3}^{3\sqrt{3}}=(3\sqrt{3})^{\sqrt{3}}$

Note that y(t) = t x(t) and $y(t) = (x(t))^t$.

▲ロト ▲理ト ▲ヨト ▲ヨト 三ヨー 釣んぐ

With $t = 1 + rac{1}{s}$, where s > 0, the parametric equations $x(t) = t^{1/(t-1)}, \qquad y(t) = t^{t/(t-1)}$

become

$$x(s) = \left(1+\frac{1}{s}\right)^s, \qquad y(s) = \left(1+\frac{1}{s}\right)^{s+1}.$$

With $t = 1 + \frac{1}{s}$, where s > 0, the parametric equations $x(t) = t^{1/(t-1)}, \qquad y(t) = t^{t/(t-1)}$

become

$$x(s) = \left(1+rac{1}{s}
ight)^s, \qquad y(s) = \left(1+rac{1}{s}
ight)^{s+1}.$$

You may recognize a familiar limit here. These equations easily generate rational numbers that satisfy $x^y = y^x$.

With $t = 1 + \frac{1}{s}$, where s > 0, the parametric equations $x(t) = t^{1/(t-1)}, \qquad y(t) = t^{t/(t-1)}$

become

$$x(s) = \left(1+rac{1}{s}
ight)^s, \qquad y(s) = \left(1+rac{1}{s}
ight)^{s+1}.$$

You may recognize a familiar limit here. These equations easily generate rational numbers that satisfy $x^y = y^x$.

$$s = 1, 2, 3$$
 gives $(2, 4), (\frac{9}{4}, \frac{27}{8}), (\frac{64}{27}, \frac{256}{81}).$

With $t = 1 + \frac{1}{s}$, where s > 0, the parametric equations $x(t) = t^{1/(t-1)}, \qquad y(t) = t^{t/(t-1)}$

become

$$x(s) = \left(1+rac{1}{s}
ight)^s, \qquad y(s) = \left(1+rac{1}{s}
ight)^{s+1}.$$

You may recognize a familiar limit here. These equations easily generate rational numbers that satisfy $x^y = y^x$.

$$s = 1, 2, 3$$
 gives $(2, 4), (\frac{9}{4}, \frac{27}{8}), (\frac{64}{27}, \frac{256}{81}).$

Rational solutions x < y if and only if s is a positive integer.

$$\ln x = \frac{\ln t}{t-1} \equiv f(t) \qquad (f(1)=1)$$

$$2(t+1)f(t) > 3 + t(f(t))^2$$

These are not difficult but a bit tedious to prove analytically.

$$t f'(t) + 1 = rac{1 - t f(t)}{t - 1} + 1 = rac{t(1 - f(t))}{t - 1}$$

$$t^{2}(t-1)^{2}(f''(t)-(f'(t))^{2})=-t^{2}(f(t))^{2}+2t(t+1)f(t)-3t$$

$$2(t+1)f(t) > 3 + t(f(t))^2$$

These are not difficult but a bit tedious to prove analytically.

◆□ ▶ < 圖 ▶ < 圖 ▶ < 圖 ▶ < 圖 • 의 Q @</p>

1. Use parametric equations.

$$x(t) = \left(1 + \frac{1}{t}\right)^t, \qquad y(t) = \left(1 + \frac{1}{t}\right)^{t+1}$$

1. Use parametric equations.

$$x(t) = \left(1 + \frac{1}{t}\right)^t, \qquad y(t) = \left(1 + \frac{1}{t}\right)^{t+1}$$
$$\frac{d^2y}{dx^2} = \frac{1}{x'(t)} \cdot \frac{d}{dt} \left(\frac{y'(t)}{x'(t)}\right)$$

1. Use parametric equations.

$$x(t) = \left(1 + \frac{1}{t}\right)^t, \qquad y(t) = \left(1 + \frac{1}{t}\right)^{t+1}$$
$$\frac{d^2y}{dx^2} = \frac{1}{x'(t)} \cdot \frac{d}{dt} \left(\frac{y'(t)}{x'(t)}\right)$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

Show that the function y'(t)/x'(t) is increasing for t > 0.

1. Use parametric equations.

$$x(t) = \left(1 + \frac{1}{t}\right)^t, \qquad y(t) = \left(1 + \frac{1}{t}\right)^{t+1}$$
$$\frac{d^2y}{dx^2} = \frac{1}{x'(t)} \cdot \frac{d}{dt} \left(\frac{y'(t)}{x'(t)}\right)$$

Show that the function y'(t)/x'(t) is increasing for t > 0.

This gets very messy. (But it does work.)

2. Return to the equation

$$\frac{\ln x}{x} = \frac{\ln E(x)}{E(x)}$$

and take two derivatives.

2. Return to the equation

$$\frac{\ln x}{x} = \frac{\ln E(x)}{E(x)}$$

and take two derivatives.

This also works but, as you may envision, it is extremely tedious.

Then $E(x) = U(\beta(x))$ for all $x \ge e$.

 β is decreasing and convex on $[e^{3/2},\infty)$;

U is increasing and convex on (0, 1/e].

It follows that $E = U \circ f$ is convex on $[e^{3/2}, \infty)$.

This gets us close, but alas, we need the interval $[e, \infty)$.

4. Use the Lambert W function (the inverse of $x e^x$).

4. Use the Lambert W function (the inverse of $x e^{x}$).

With a little effort, we can show that

$${\sf E}(x)=\exp(-W(-eta(x))) \quad ext{and} \quad {\sf E}(x)=rac{W(-eta(x))}{-eta(x)}.$$

4. Use the Lambert W function (the inverse of $x e^{x}$).

With a little effort, we can show that

$$E(x) = \exp(-W(-eta(x))) \quad ext{and} \quad E(x) = rac{W(-eta(x))}{-eta(x)}.$$

The first expression can be used to show that *E* is convex on the interval $[e^{3/2}, \infty)$.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

The first expression can be used to show that *E* is convex on the interval $[e^{3/2}, \infty)$.

For this approach, we need to use an abstract function and, more importantly, we still come up short.

So, we humbly state, it seems that our method is the best.

So, we humbly state, it seems that our method is the best.

The convexity of the curve $x^y = y^x$, to appear in *Math. Gazette*.

coauthor: Alan Beardon, University of Cambridge
