- Example with an Autoencoder
- Next autoencoder
- The softmax layer comes from the softmax algorithm we used earlier
- Construct the deep network
- Train the deep net (This is "fine tuning" the net)

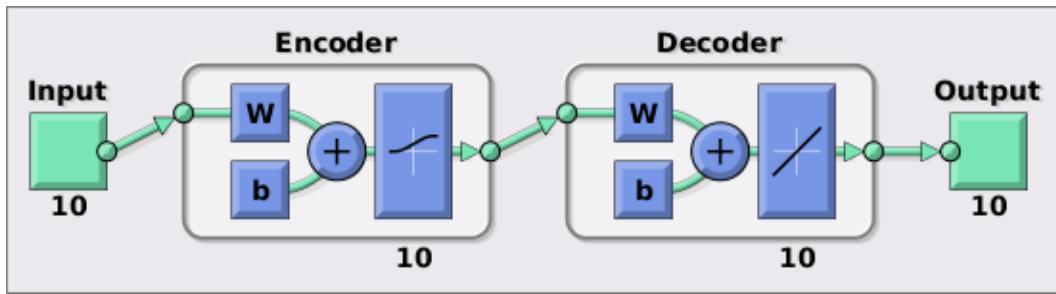

Example with an Autoencoder

```
% The data:  
[X,T] = wine_dataset;  
  
% Construction of the first autoencoder:  
hiddenSize = 10;  
autoenc1 = trainAutoencoder(X,hiddenSize,...  
    'L2WeightRegularization',0.001,...  
    'SparsityRegularization',4,...  
    'SparsityProportion',0.05,...  
    'DecoderTransferFunction','purelin');  
  
% Extract the "features" in the hidden layer  
features1 = encode(autoenc1,X);  
  
view(autoenc1);
```

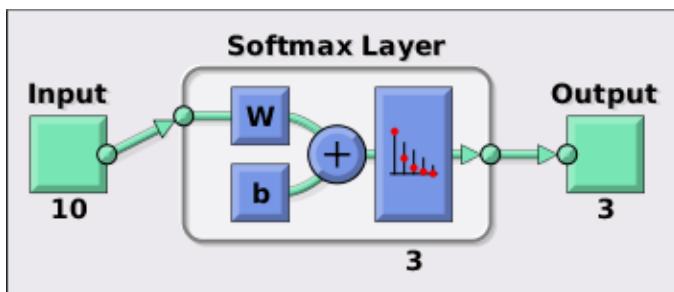

Next autoencoder

```
% Construction of a second autoencoder  
hiddenSize = 10;  
autoenc2 = trainAutoencoder(features1,hiddenSize,...  
    'L2WeightRegularization',0.001,...  
    'SparsityRegularization',4,...  
    'SparsityProportion',0.05,...  
    'DecoderTransferFunction','purelin',...  
    'ScaleData',false);  
  
% Extract the features on the hidden layer  
features2 = encode(autoenc2,features1);  
  
view(autoenc2);
```

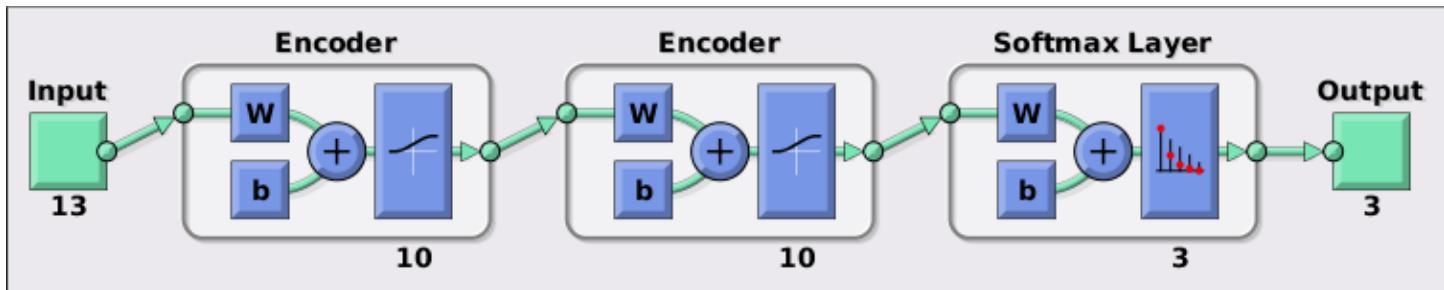

The softmax layer comes from the softmax algorithm we used earlier

```
%Train a softmax layer:  
softnet = trainSoftmaxLayer(features2,T,'LossFunction','crossentropy');  
  
view(softnet);
```

Construct the deep network

```
% Stack the encoders together to get the deep network:  
deepnet = stack(autoenc1,autoenc2,softnet);  
  
view(deepnet);
```

Train the deep net (This is "fine tuning" the net)

```
[deepnet,tr]=train(deepnet,X,T);  
  
wine_type=deepnet(X);  
  
plotconfusion(T,wine_type)
```

		Confusion Matrix			
		1	2	3	
Output Class	1	59 33.1%	0 0.0%	0 0.0%	100% 0.0%
	2	0 0.0%	71 39.9%	0 0.0%	100% 0.0%
